

1 Statically Typed String Sanitation Inside a 2 Python: Technical Report

3 Nathan Fulton Cyrus Omar Jonathan Aldrich

4 October 18, 2014

5 **Abstract**

6 This Technical Report contains supporting materials for Statically
7 Typed String Sanitation Inside a Python [1] including proofs of lem-
8 mas and theorems asserted in the paper, examples, and additional
9 discussion of the paper’s technical content.

10 Theorems and lemmas appearing in [1] are numbered, while supporting
11 facts appearing only in the Technical Report are lettered. Numbered items
12 correspond to the numbering in [1].

13 **1 Proofs of Lemmas and Theorems about λ_{RS}**

14 This section presents proofs of lemmas and theorems about the type systems
15 presented in [1], the accompanying paper. In addition, we provide some
16 examples to help motivate and explain definitions.

17 To facilitate the type safety proof, we introduce a small step semantics
18 for both λ_{RS} and λ_P . All theorems in this section are proven as stated in [1].

19 **1.1 Head and Tail Operations**

20 **Definition 1** (Definition of $\text{lhead}(r)$). The relation $\text{lhead}(r) = r'$ is defined
21 in terms of the structure of r :

- 22 • $\text{lhead}(\epsilon) = \epsilon$
- 23 • $\text{lhead}(.) = a_1 + a_2 + \dots + a_n$ for all $a_i \in \Sigma$ where $|\Sigma| = n$.

- 24 • $\text{lhead}(a) = a$
- 25 • $\text{lhead}(r_1 \cdot r_2) = \text{lhead}(r_1)$
- 26 • $\text{lhead}(r_1 + r_2) = \text{lhead}(r_1) + \text{lhead}(r_2)$
- 27 • $\text{lhead}(r*) = \epsilon + \text{lhead}(r)$

28 **Definition 2** (Brzozowski's Derivative). The *derivative of r with respect to*
 29 *s* is denoted by $\delta_s(r)$ and is $\delta_s(r) = \{t \mid st \in \mathcal{L}\{r\}\}$.

30 **Definition 3** (Definition of $\text{ltail}(r)$). The relation $\text{ltail}(r) = r'$ is defined
 31 in terms of $\text{lhead}(r)$. Note that $\text{lhead}(r) = a_1 + a_2 + \dots + a_i$. We define
 32 $\text{ltail}(r) = \delta_{a_1}(r) + \delta_{a_2}(r) + \dots + \delta_{a_i}(r)$.

33 **TR Example A** (All the heads of all the tails can be more than one head
 34 and tail). $r \neq \text{lhead}(r) \cdot \text{ltail}(r)$.

35 *Proof.* A simple counter-example is $ab + cd$. Note that $\text{lhead}(ab + cd) = a + c$
 36 and $\text{ltail}(ab + cd) = b + d$. Therefore, $\{ad, bc\} \subset \mathcal{L}\{\text{lhead}(ab + cd) \cdot \text{ltail}(ab + cd)\}$
 37 even though neither of these is in $\mathcal{L}\{r\}$. \square

38 Example A does not imply a counter-example to type soundness because
 39 $s \in \mathcal{L}\{r\} \implies s \in \text{lhead}(r) \cdot \text{ltail}(r)$ is the property required for soundness.
 40 Still, in a production implementation, it will make sense to massage the def-
 41 initions of $\text{lhead}(r)$ and $\text{ltail}(r)$ so that type information is not unnecessarily
 42 lost during substring operations.

43 This is a general pattern in string operations: λ_{RS} simulates – within
 44 the type system – common operations on strings. If there is an operation for
 45 concatenating to strings, we define an operation for concatenating two regular
 46 expressions. If there is an operation for peeling off the first (n) characters
 47 of a string, then we define an operation for converting a regular expression r
 48 into a regular expression r' which recognizes any n^{th} suffix of a string in r .

49 It is important to note, however, that the type system need not *exactly*
 50 simulate the action of string operations. In the case of concatenation, we
 51 lose some information because more string values are possible – according
 52 the types – than are actually possible in the dynamic semantics. Soundness
 53 is not lost because the types are conservative in their approximation.

54 In the case of string replacement, there are *trivial* definitions of substitu-
 55 tion (on strings) and replacement (on languages) which over-approximate the
 56 effect of a substitution. Closing these gaps in approximation is important,
 57 and motivates the string operations portion of this technical report.

1.2 Some Corollaries About Substitution and Language Replacement

Definition 4 (**subst**). We consider several choices in the string operations section.

Definition 5 (**lreplace**). We consider several choices in the string operations section.

Proposition 6 (Closure). *If $\mathcal{L}\{r\}$, $\mathcal{L}\{r_1\}$ and $\mathcal{L}\{r_2\}$ are regular languages, then $\mathcal{L}\{\text{lreplace}(r, r_1, r_2)\}$ is also a regular language.*

Proof. This result is proven for various formulations in the next section. \square

Proposition 7 (Substitution Correspondence). *If $s_1 \in \mathcal{L}\{r_1\}$ and $s_2 \in \mathcal{L}\{r_2\}$ then $\text{subst}(r; s_1; s_2) \in \mathcal{L}\{\text{lreplace}(r, r_1, r_2)\}$.*

Proof. This is exactly the correctness result proven for some pairs of **subst** and **replace** in the previous section. \square

Lemma 8 (Properties of Regular Languages.).

- *If $s_1 \in \mathcal{L}\{r_1\}$ and $s_2 \in \mathcal{L}\{r_2\}$ then $s_1 s_2 \in \mathcal{L}\{r_1 \cdot r_2\}$.*
- *For all strings s and regular expressions r , either $s \in \mathcal{L}\{r\}$ or $s \notin \mathcal{L}\{r\}$.*
- *Regular languages are closed under reversal.*

Lemma 8 states some well-known properties about regular expressions.

Lemma 9. *If $\emptyset \vdash e : \text{stringin}[r]$ then r is a well-formed regular expression.*

Proof. The proof proceeds by induction on the derivation of the premise. The only non-trivial cases (those which require more than an appeal to inversion) are S-T-Case, S-T-Replace and S-T-Concat.

In the S-T-Case case, note that **lhead** and **ltail** are total functions for well-formed regular expressions to well-formed regular expressions.

In the S-T-Concat case, note that Lemma 6 implies that if r_1 and r_2 are regular expressions then so is $r_1 \cdot r_2$.

In the S-T-Replace case, it suffices to show that **lreplace**(r, r_1, r_2) is a regular expression assuming (inductively) that r, r_1 and r_2 are all regular expressions. This follows from the Closure proposition. \square

1.3 The Small Step Semantics

To prove type safety and the security theorems for the big step semantics, we first prove type safety for a small step semantics in Figure 7 and then extend this to the big step semantics in Figure 5 by proving a correspondence between the semantics.

TR Conjecture B. *if $\emptyset \vdash e : \sigma$ then $e \mapsto^* v$ such that v val.*

We do not develop the full proof here, but note that the simply typed lambda calculus terminates. For the string fragment, observe that the S-T- rules do not add any non-trivial binding structure because substitutions $[e/x]e'$ may only occur in the special case where $e = \mathbf{rstr}[s]$, so that the length of the term never increases and the number of free variables strictly decreases. Therefore, the standard normalization argument proceeds without complication after fixing an evaluation order for the compatibility rules (all our other proofs are agnostic to evaluation order).

TR Lemma C (Canonical Forms). *Suppose v val.*

If $\emptyset \vdash v : \mathbf{stringin}[r]$ then $v = \mathbf{rstr}[s]$.

If $\emptyset \vdash v : \sigma \rightarrow \sigma'$ then $v = \lambda x.e'$ for some e' .

Proof. By inspection of valuation and typing rules. □

For the sake of completeness, we include a statement of the weaker lemma stated in the paper:

Lemma 10 (Canonical Forms for the String Fragment of λ_{RS}). *If $\emptyset \vdash e : \mathbf{stringin}[r]$ and $e \Downarrow v$ then $v = \mathbf{rstr}[s]$.*

Proof. This fact follows directly from Lemma C. □

TR Lemma D (Progress of small step semantics.). *If $\emptyset \vdash e : \sigma$ either e val or $e \mapsto e'$ for some e' .*

Proof. The proof proceeds by induction on the derivation of $\emptyset \vdash e : \sigma$.

λ fragment. Cases SS-T-Var, SS-T-Abs, and SS-T-App are exactly as in a proof of type safety for the simply typed lambda calculus.

S-T-Stringin-I. Suppose $\emptyset \vdash \mathbf{rstr}[s] : \mathbf{stringin}[s]$. The $\mathbf{rstr}[s]$ val by SS-E-RStr.

117 **S-T-Concat.** Suppose $\emptyset \vdash \text{rconcat}(e_1; e_2) : \text{stringin}[s]$. By inversion
 118 and induction, $e_1 \mapsto e'_1$ or $e_1 \text{ val}$ and similarly for e_2 . If e_1 steps,
 119 then SS-E-Concat-Left applies and so $\text{rconcat}(e_1; e_2) \mapsto \text{rconcat}(e'_1; e_2)$.
 120 Similarly, if e_2 steps then e steps by SS-E-Concat-Right.

121 In the remaining case, $e_1 \text{ val}$ and $e_2 \text{ val}$. But then it follows by Canonical
 122 Forms that $e_1 = \text{rstr}[s_1]$ and $e_2 = \text{rstr}[s_2]$. Finally, by SS-E-Concat,
 123 $\text{rconcat}(\text{rstr}[s_1]; \text{rstr}[s_2]) \mapsto \text{rstr}[s_1 s_2]$.

124 **S-T-Case.** Suppose $e = \text{rstrcase}(e_1; e_2; x, y.e_3)$. By inversion,
 125 $\emptyset \vdash e_1 : \text{stringin}[r]$. From this fact, induction, and Canonical Forms
 126 it follows that $e_1 \mapsto e'_1$ or $e_1 = \text{rstr}[s]$. In the former case, e steps by
 127 S-E-Case-Left. In the latter case, note that $s = \epsilon$ or $s = at$ for some
 128 string t . If $s = \epsilon$ then e steps by S-E-Case- ϵ -Val, and if $s = at$ the e
 129 steps by S-E-Case-Concat.

S-T-Replace. Suppose $e = \text{rreplace}[r](e_1; e_2)$ and $\emptyset \vdash e : \text{stringin}[r']$
 where, by inversion of S-T-Replace,

$$\emptyset \vdash e_1 : \text{stringin}[r_1] \quad (1)$$

$$\emptyset \vdash e_2 : \text{stringin}[r_2] \quad (2)$$

$$\text{lreplace}(r, r_1, r_2) = r' \quad (3)$$

130 By (1), inversion and induction $e_1 \text{ val}$ or $e_1 \mapsto e'_1$ for some e'_1 . If $e_1 \mapsto e'_1$
 131 then e steps by SS-E-Replace-Left. Similarly, if e_2 steps then e steps by
 132 SS-E-Replace-Right. The only remaining case is where $e_1 \text{ val}$ and also
 133 $e_2 \text{ val}$. But then by Canonical Forms, $e_1 = \text{rstr}[s_1]$ and $e_2 = \text{rstr}[s_2]$.
 134 Therefore, $e \mapsto \text{rstr}[\text{subst}(r; s_1; s_2)]$ by SS-E-Replace.

135 **S-T-SafeCoerce.** Suppose that $\emptyset \vdash \text{rcoerce}[r](e_1) : \text{stringin}[r]$. By
 136 inversion of S-T-SafeCoerce, $\emptyset \vdash e_1 : \text{stringin}[r']$ for $\mathcal{L}\{r'\} \subseteq \mathcal{L}\{r\}$. By
 137 induction, $e_1 \text{ val}$ or $e_1 \mapsto e'_1$ for some e'_1 . If $e_1 \mapsto e'_1$ then e steps
 138 by SS-E-SafeCoerce-Step. Otherwise, $e_1 \text{ val}$ and by Canonical Forms
 139 $e_1 = \text{rstr}[s]$. In this case, $e = \text{rcoerce}[r](\text{rstr}[s]) \mapsto \text{rstr}[s]$ by SS-E-
 140 SafeCoerce.

S-T-SafeCheck Suppose that $\emptyset \vdash \text{rcheck}[r](e_0; x.e_1; e_2) : \text{stringin}[r]$.

By inversion of S-T-Check:

$$\vdash e_0 : \text{stringin}[r_0] \quad (4)$$

$$x : \text{stringin}[r] \vdash e_1 : \sigma \quad (5)$$

$$\vdash e_2 : \sigma \quad (6)$$

141 By (6) and induction, $e_0 \mapsto e'_0$ or e_0 **val**. In the former case e steps by
 142 SS-E-Check-StepRight. Otherwise, $e_0 = \text{rstr}[s]$ by Canonical Forms.
 143 By Lemma 8, either $s \in \mathcal{L}\{r_0\}$ or $s \notin \mathcal{L}\{r_0\}$. In the former case e
 144 takes a step by SS-E-Check-Ok. In the latter case e takes a step by
 145 SS-E-Check-NotOk.

146 □

147 **TR Lemma E** (Preservation for Small Step Semantics). *If $\emptyset \vdash e : \sigma$ and*
 148 *$e \mapsto e'$ then $\emptyset \vdash e' : \sigma$.*

149 *Proof.* By induction on the derivation of $e \mapsto e'$.

150 **λ fragment.** Cases SS-T-Var, SS-T-Abs, and SS-T-App are exactly as
 151 in a proof of type safety for the simply typed lambda calculus.

152 **SS-E-Concat-Left.** Suppose $e = \text{rconcat}(e_1; e_2) \mapsto \text{rconcat}(e'_1; e_2)$ and
 153 $e_1 \mapsto e'_1$. By inversion of S-T-Concat, $\emptyset \vdash e_1 : \text{stringin}[r_1]$ where
 154 $\emptyset \vdash e : \text{stringin}[r_1 r_2]$. By induction, if $e_1 \mapsto e'_1$ then $\emptyset \vdash e'_1 : \text{stringin}[r_1]$.
 155 Therefore, $\emptyset \vdash \text{rconcat}(e'_1; e_2) : \text{stringin}[r_1 r_2]$.

156 **SS-E-Concat-Right.** Similar to SS-E-Concat-Left.

157 **SS-E-Concat.** Suppose $\emptyset \vdash \text{rconcat}(\text{rstr}[s_1]; \text{rstr}[s_2]) : \text{stringin}[r_1 r_2]$ and
 158 $\text{rconcat}(\text{rstr}[s_1]; \text{rstr}[s_2]) \mapsto \text{rstr}[s_1 s_2]$. Then by inversion $\emptyset \vdash \text{rstr}[s_1] :$
 159 $\text{stringin}[r_1]$ and similarly for $\text{rstr}[s_2]$. Therefore, $s_1 \in \mathcal{L}\{r_1\}$ and
 160 $s_2 \in \mathcal{L}\{r_2\}$ from which it follows by Lemma 8 that $s_1 s_2 \in \mathcal{L}\{r_1 r_2\}$.
 161 Therefore, $\emptyset \vdash \text{rstr}[s_1 s_2] : \text{stringin}[r_1 r_2]$ by S-T-Rstr.

S-E-Case-Left. Suppose that $e = \text{rstrcase}(e_1; e_2; x, y.e_3)$ and also that
 $e \mapsto \text{rstrcase}(e'_1; e_2; x, y.e_3)$ and $\emptyset \vdash e : \text{stringin}[r]$. By inversion of S-T-
 Case:

$$\emptyset \vdash e_1 : \text{stringin}[r] \quad (7)$$

$$\emptyset \vdash e_2 : \sigma \quad (8)$$

$$x : \text{stringin}[\text{lhead}(r)], y : \text{stringin}[\text{ltail}(r)] \vdash e_3 : \sigma \quad (9)$$

162 By (7) and the assumption that $e_1 \mapsto e'_1$, it follows by induction that
 163 $\emptyset \vdash e'_1 : \text{stringin}[r]$. This fact together with (8) and (9) implies by
 164 S-T-Case that $\emptyset \vdash \text{rstrcase}(e'_1; e_2; x, y.e_3) : \sigma$.

SS-E-Case-Right. We have that $e = \text{rstrcase}(e_1; e_2; x, y.e_3)$, Suppose
 $e \mapsto \text{rstrcase}(e_1; e'_2; x, y.e_3)$ and $\emptyset \vdash e : \text{stringin}[r]$. By inversion of S-T-
 Case:

$$\emptyset \vdash e_1 : \text{stringin}[r] \quad (10)$$

$$\emptyset \vdash e_2 : \sigma \quad (11)$$

$$x : \text{stringin}[\text{lhead}(r)], y : \text{stringin}[\text{ltail}(r)] \vdash e_3 : \sigma \quad (12)$$

165 By (11) and the assumption that $e_2 \mapsto e'_2$, it follows by induction that
 166 $\emptyset \vdash e'_2 : \text{stringin}[r]$. This fact together with (10) and (12) implies by
 167 S-T-Case that $\emptyset \vdash \text{rstrcase}(e_1; e'_2; x, y.e_3) : \sigma$.

SS-E-Case-Val. Suppose:

$$e = \text{rstrcase}(-; e_2; -)$$

$$\emptyset \vdash e : \sigma$$

$$e \mapsto e_2$$

168 By inversion of S-T-Case, $e_2 : \sigma$.

SS-E-Case-Concat. Suppose that $e = \text{rstrcase}(\text{rstr}[as]; e_2; x, y.e_3) \mapsto$
 $[\text{rstr}[a], \text{rstr}[s]/x, y]e_3$ and that $\emptyset \vdash e : \sigma$. By inversion of S-T-Case:

$$\emptyset \vdash \text{rstr}[as] : \text{stringin}[r] \quad (13)$$

$$\emptyset \vdash \text{rstr}[e_2] : \sigma \quad (14)$$

$$x : \text{stringin}[\text{lhead}(r)], y : \text{stringin}[\text{ltail}(r)] \vdash e_3 : \sigma \quad (15)$$

169 We know that $as \in \mathcal{L}\{r\}$ by (13) and inversion of S-T-Rstr. Therefore,
 170 $a \in \mathcal{L}\{\text{lhead}(r)\}$ by definition of lhead . Furthermore, $\text{ltail}(r) = \dots|\delta_a r| \dots$
 171 by definition of ltail . Note that $s \in \mathcal{L}\{\delta_a r\}$ by definition of the deriva-
 172 tive, and so $s \in \mathcal{L}\{\text{ltail}(r)\}$

173 From these facts about a and s we know by S-T-Rstr that $\emptyset \vdash \text{rstr}[a] :$
 174 $\text{stringin}[\text{lhead}(r)]$ and $\emptyset \vdash \text{rstr}[s] : \text{stringin}[\text{lhead}(r)]$. It follows by (15)
 175 that $\emptyset \vdash [\text{rstr}[a], \text{rstr}[s]/x, y]e_3 : \sigma$.

176 Cases **SS-E-Replace-Left**, **SS-E-Replace-Right**, **SS-E-Check-**
 177 **StepLeft**, **SS-E-SafeCoerce-Step**, **SS-E-Check-StepRight**. At
 178 this point the method for handling compatibility cases is clear; there-
 179 fore, we elide these cases.

180 **Case SS-E-Replace.**

Suppose $e = \text{rreplace}[r](\text{rstr}[s_1]; \text{rstr}[s_2]) \mapsto \text{rstr}[\text{subst}(r; s_1; s_2)]$. Assume $\emptyset \vdash e : \text{stringin}[r']$ for $r' = \text{lreplace}(r, r_1, r_2)$. Then by inversion of S-T-Replace:

$$\begin{aligned} \emptyset \vdash \text{rstr}[s_1] &: \text{stringin}[r_1] \\ \emptyset \vdash \text{rstr}[s_2] &: \text{stringin}[r_2] \end{aligned}$$

181 from which follows that $s_1 \in \mathcal{L}\{r_1\}$ and $s_2 \in \mathcal{L}\{r_2\}$. Therefore,
 182 $\text{subst}(r; s_1; s_2) \in \mathcal{L}\{\text{lreplace}(r, r_1, r_2)\}$ by Theorem 7. It is finally
 183 derivable by S-T-Rstr that:

$$184 \quad \emptyset \vdash \text{rstr}[\text{subst}(r; s_1; s_2)] : \text{stringin}[\text{lreplace}(r, r_1, r_2)].$$

185 **Case SS-E-SafeCoerce.** Suppose that $\text{rcoerce}[r](s_1) \mapsto \text{rstr}[s_1]$ and
 186 that $\emptyset \vdash \text{rcoerce}[r](s_1) : \text{stringin}[r]$. By inversion of S-T-SafeCoerce we
 187 know that $s \in \mathcal{L}\{r\}$. Therefore, $\emptyset \vdash s : \text{stringin}[r]$.

188 **Case SS-E-Check-Ok.** Suppose $\text{rcheck}[r](\text{rstr}[s]; x.e_1; e_2) \mapsto [\text{rstr}[s]/x]e_1$,
 189 $s \in \mathcal{L}\{r\}$, and $\emptyset \vdash \text{rcheck}[r](\text{rstr}[s]; x.e_1; e_2) : \sigma$. By inversion of S-T-
 190 Check, $x : \text{stringin}[r] \vdash e_1 : \sigma$. Note that $s \in \mathcal{L}\{r\}$ implies that
 191 $s : \text{stringin}[r]$ by S-T-RStr. Therefore, $\emptyset \vdash [\text{rstr}[s]/x]e_1 : \sigma$.

192 **Case SS-E-Check-NotOk.** Suppose $\text{rcheck}[r](\text{rstr}[s]; x.e_1; e_2) \mapsto e_2$,
 193 $s \notin \mathcal{L}\{r\}$, and $\emptyset \vdash \text{rcheck}[r](\text{rstr}[s]; x.e_1; e_2) : \sigma$. By inversion of S-T-
 194 Check, $\emptyset \vdash e_2 : \sigma$.

195 □

196 **TR Theorem F** (Type Safety for small step semantics.). *If $\emptyset \vdash e : \sigma$ then*
 197 *either $e \text{ val}$ or $e \mapsto^* e'$ and $\emptyset \vdash e' : \sigma$.*

198 *Proof.* Follows directly from progress and preservation. □

199 **1.3.1 Semantic Correspondence between Big and Small Step Se-**
 200 **mantics for λ_{RS}**

201 Before extending the previous theorem to the big step semantics, we first
 202 establish a correspondence between the big step semantics in Figure 7 and
 203 the small step semantics in Figure 5.

204 **TR Theorem G** (Semantic Correspondence for λ_{RS} (Part I)). *If $e \Downarrow v$ then*
 205 *$e \mapsto^* v$.*

206 *Proof.* We proceed by structural induction on e .

207 **Case** $e = \lambda x.e_1$. The only applicable rule is S-E-Abs, so $v = \lambda x.e_1$.
 208 Note that $\lambda x.e_2 \mapsto^* \lambda x.e_2$ by RT-Refl.

Case $e = e_1(e_2)$. The only applicable rule is S-E-App. By inversion,
 we establish that the following:

$$\begin{aligned} e_1 &\Downarrow \lambda x.e'_1 \\ e_2 &\Downarrow v_2 \\ [v_2/x]e'_1 &\Downarrow v \end{aligned}$$

From which it follows by induction that:

$$\begin{aligned} e_1 &\mapsto^* \lambda x.e'_1 \\ e_2 &\mapsto^* v_2 \\ [v_2/x]e'_1 &\mapsto^* v \end{aligned}$$

Note that the following rule is derivable by repeating applications of
 the left and right compatibility rules for application:

$$\frac{\text{L*-APP} \quad e_1 \mapsto^* e'_1 \quad e_2 \mapsto^* e'_2}{e_1(e_2) \mapsto^* e'_1(e'_2)}$$

209 From these facts and L-AppAbs, we may establish that $e_1(e_2) \mapsto^*$
 210 $(\lambda x.e_2)(v_2) \mapsto [v_2/x]e_2$. Note that $[v_2/x]e_2 \mapsto^* v$, so by RT-Trans it
 211 follows that $e = e_1(e_2) \mapsto^* v$.

212 **Case** $e = \mathbf{rstr}[s]$. The only applicable rule is S-E-RStr, so $v = \mathbf{rstr}[s]$.
 213 By RT-Refl, $\mathbf{rstr}[s] \mapsto^* \mathbf{rstr}[s]$.

Case $e = \mathbf{rconcat}(e_1; e_2)$. The only applicable rule is S-E-Concat, so
 $v = \mathbf{rstr}[s_1 s_2]$. By inversion, $e_1 \Downarrow \mathbf{rstr}[s_1]$ and $e_2 \Downarrow \mathbf{rstr}[s_2]$. By induction,
 $e_1 \mapsto^* \mathbf{rstr}[s_1]$ and $e_2 \mapsto^* \mathbf{rstr}[s_2]$. Note that the rule following is
 derivable:

$$\frac{\text{SS-E-CONCAT-LR}^* \quad \begin{array}{c} e_1 \mapsto^* e'_1 \quad e_2 \mapsto^* e'_2 \end{array}}{\mathbf{rconcat}(e_1; e_2) \mapsto^* \mathbf{rconcat}(e'_1; e'_2)}$$

214 From these facts, it follows that $\mathbf{rconcat}(e_1; e_2) \mapsto^* \mathbf{rconcat}(\mathbf{rstr}[s_1]; \mathbf{rstr}[s_2])$.
 215 Finally, $\mathbf{rconcat}(\mathbf{rstr}[s_1]; \mathbf{rstr}[s_2]) \mapsto \mathbf{rstr}[s_1 s_2]$ by SS-E-Concat. By RT-
 216 Step, it follows that $\mathbf{rconcat}(e_1; e_2) \mapsto^* \mathbf{rstr}[s_1 s_2]$.

217 **Case** $e = \mathbf{rstrcase}(e_1; e_2; x, y.e_3)$.

There are two subcases. For the first, suppose $\mathbf{rstrcase}(e_1; e_2; x, y.e_3) \Downarrow v$
 was finally derived by S-E-Case- ϵ . By inversion:

$$\begin{array}{c} e_1 \Downarrow \mathbf{rstr}[\epsilon] \\ e_2 \Downarrow v \end{array}$$

from which it follows by induction that:

$$\begin{array}{c} e_1 \mapsto^* \mathbf{rstr}[\epsilon] \\ e_2 \mapsto^* v \end{array}$$

218 Note that the following rule is derivable:

$$\frac{\text{SS-E-CASE-LR}^* \quad \begin{array}{c} e_1 \mapsto^* e'_1 \quad e_2 \mapsto^* e'_2 \end{array}}{\mathbf{rstrcase}(e_1; e_2; x, y.e_3) \mapsto^* \mathbf{rstrcase}(e'_1; e'_2; x, y.e_3)}$$

219 From these facts it follows that $e \mapsto^* \mathbf{rstrcase}(\mathbf{rstr}[\epsilon]; v; x, y.e_3)$. By
 220 S-E-Case- ϵ -Val and RT-Step it follows that $e \mapsto^* v$.

221 Now consider the other case where $\mathbf{rstrcase}(e_1; e_2; x, y.e_3) \Downarrow v$ was finally
 222 derived by S-E-Case-Concat. By inversion, $e_1 \Downarrow \mathbf{rstr}[as]$ and

223 $[\mathbf{rstr}[a], \mathbf{rstr}[s]/x, y]e_3 \Downarrow v$. From these facts it follows by induction that
 224 $e_1 \mapsto^* \mathbf{rstr}[as]$ and $[\mathbf{rstr}[a], \mathbf{rstr}[s]/x, y]e_3 \mapsto^* v$.

225 By the first of these facts, it is derivable via SS-E-Case-LR* that
 226 $e \mapsto^* \mathbf{rstrcase}(e'_1; \mathbf{rstr}[as]; x, y.e_3)$. SE-E-Case-Concat applies to this
 227 form, so by RT-Step we know $e \mapsto^* [\mathbf{rstr}[a], \mathbf{rstr}[s]/x, y]e_3$. Recall that
 228 $[\mathbf{rstr}[a], \mathbf{rstr}[s]/x, y]e_3 \mapsto^* v$, so by RT-Trans we finally derive $e \mapsto^* v$.

Case $e = \mathbf{rreplace}[r](e_1; e_2)$. There is only one applicable rule, so $v = \mathbf{rstr}[s]$ and by inversion it follows that:

$$\begin{aligned} e_1 &\Downarrow \mathbf{rstr}[s_1] \\ e_2 &\Downarrow \mathbf{rstr}[s_2] \end{aligned}$$

From which it follows by induction that:

$$\begin{aligned} e_1 &\mapsto^* \mathbf{rstr}[s_1] \\ e_2 &\mapsto^* \mathbf{rstr}[s_2] \end{aligned}$$

229 Furthermore, $\mathbf{subst}(r; s_1; s_2) = s$ by induction. Note that the following
 230 rule is derivable:

$$\frac{\text{SS-E-REPLACE-LR}^* \quad \begin{array}{c} e_1 \mapsto^* e'_1 \quad e_2 \mapsto^* e'_2 \end{array}}{\mathbf{rreplace}[r](e_1; e_2) \mapsto^* \mathbf{rreplace}[r](e'_1; e'_2)}$$

231 From these facts, $\mathbf{rreplace}[r](e_1; e_2) \mapsto^* \mathbf{rreplace}[r](\mathbf{rstr}[s_1]; \mathbf{rstr}[s_2])$.

232 Finally, $\mathbf{rreplace}[r](\mathbf{rstr}[s_1]; \mathbf{rstr}[s_2]) \mapsto \mathbf{subst}(r; s_1; s_2)$.

233 From these two facts we know via RT-Step that $\mathbf{rreplace}[r](e_1; e_2) \mapsto^*$
 234 $\mathbf{rreplace}[r](e_1; e_2)$. Recall that $\mathbf{subst}(r; s_1; s_2) = s$, from which the con-
 235 clusion follows.

236 **Case** $e = \mathbf{rcoerce}[r](e_1)$. In this case $e \Downarrow v$ is only finally derivable via
 237 S-E-SafeCoerce. Therefore, $v = \mathbf{rstr}[s]$ and by inversion $e_1 \Downarrow \mathbf{rstr}[s]$. By
 238 induction, $e_1 \mapsto^* \mathbf{rstr}[s]$.

239 The following rule is derivable:

$$\frac{\text{SS-E-SAFE-CoERCE-STEP} \quad e \mapsto^* e'}{\text{rcoerce}[r](e) \mapsto^* \text{rcoerce}[r](e')}$$

240 Applying this rule at $e_1 \mapsto^* \mathbf{rstr}[s]$ derives $\text{rcoerce}[r](e_1) \mapsto^* \text{rcoerce}[r](\mathbf{rstr}[s])$.
 241 In the final step, $\text{rcoerce}[r](\mathbf{rstr}[s]) \mapsto \mathbf{rstr}[s]$ by SS-E-SafeCoerce. From
 242 this fact, we may derive via RT-Trans that $e \mapsto^* \mathbf{rstr}[s]$ as required.

243 **Case** $e = \text{rcheck}[r](e_1; x.e_2; e_3)$.

244 Note that the rule following is derivable:

$$\frac{\text{SS-E-CHECK-STEP} \quad e_1 \mapsto^* e'_1 \quad e_3 \mapsto^* e'_3}{\text{rcheck}[r](e_1; x.e_2; e_3) \mapsto^* \text{rcheck}[r](e'_1; x.e_2; e'_3)}$$

245 There are two ways to finally derive $e \Downarrow v$. In both cases, $e_1 \Downarrow \mathbf{rstr}[s]$
 246 by inversion. Therefore, in both cases, $e_1 \mapsto^* \mathbf{rstr}[s]$ by induction and
 247 so $e \mapsto^* \text{rcheck}[r](\mathbf{rstr}[s]; x.e_2; e_3)$ by SS-E-Check-Step.

248 Suppose $e \Downarrow v$ is finally derived via SS-E-Check-Ok. By the facts
 249 mentioned above and SS-E-Check-Step, $e \mapsto^* \text{rcheck}[r](\mathbf{rstr}[s]; x.e_2; e_2)$.
 250 Note that by inversion $s \in \mathcal{L}\{r\}$. Therefore, SS-E-Check-Ok applies
 251 and so by RT-Trans $e \mapsto^* [\mathbf{rstr}[s]/x]e_1$. By inversion, $[\mathbf{rstr}[s]/x]e_1 \Downarrow v$.
 252 Therefore, by induction and RT-Step $e \mapsto^* v$ as required.

253 Suppose that $e \Downarrow v$ is instead finally derived via SS-E-Check-NotOk.
 254 By inversion, $e_3 \Downarrow v$ and by induction $e_3 \mapsto^* v$. From these facts at
 255 SS-E-Check-Step, it is derivable that $e \mapsto^* \text{rcheck}[r](\mathbf{rstr}[s]; x.e_2; v)$.

256 Also by inversion, $s \notin \mathcal{L}\{r\}$ and so SS-E-Check-NotOk applies. There-
 257 fore, $\text{rcheck}[r](\mathbf{rstr}[s]; x.e_2; v) \mapsto v$.

258 The conclusion $e \mapsto^* v$ follows from these facts by RT-Step.

259 □

260 **TR Theorem H** (Semantic Correspondence for λ_{RS} (Part II)). *If $\emptyset \vdash e : \sigma$,*
 261 *$e \mapsto^* v$ and $v \mathbf{val}$ then $e \Downarrow v$.*

262 *Proof.* The proof proceeds by structural induction on e .

263 **Case** $e = \text{concat}(e_1; e_2)$. By inversion, $\emptyset \vdash e_1 : \text{stringin}[r_1]$. By Type
264 Safety, Canonical Forms and Termination it follows that $e_1 \mapsto^* \text{rstr}[s_1]$
265 for some s_1 . By induction, $e_1 \Downarrow \text{rstr}[s_1]$.

266 Similarly, $e_2 \mapsto^* \text{rstr}[s_2]$ and $e_2 \Downarrow \text{rstr}[s_2]$.

267 Note that $\text{concat}(e_1; e_2) \mapsto^* \text{concat}(\text{rstr}[s_1]; \text{rstr}[s_2]) \mapsto \text{rstr}[s_1 s_2]$ by SS-
268 E-Concat-LR* and S-E-Concat. Therefore, $e \mapsto^* \text{rstr}[s_1 s_2]$ by RT-Step.
269 So it suffices to show that $e \Downarrow \text{rstr}[s_1 s_2]$.

270 Finally, $e \Downarrow \text{rstr}[s_1 s_2]$ follows via S-E-Concat from the facts that $e_1 \Downarrow$
271 $\text{rstr}[s_1]$ and $e_2 \Downarrow \text{rstr}[s_2]$. This completes the case.

272 **Case** $e = \text{rreplace}[r](e_1; e_2)$. By inversion of S-T-Replace, $\emptyset \vdash e_1 :$
273 $\text{stringin}[r_1]$ for some r_1 . It follows by Type Safety, Termination and
274 Canonical Forms that $e_1 \mapsto^* \text{rstr}[s_1]$. By induction, $e_1 \Downarrow \text{rstr}[s_1]$.

275 Similarly, $e_2 \mapsto^* \text{rstr}[s_2]$ and $e_2 \Downarrow \text{rstr}[s_2]$.

276 Note that $e \mapsto^* \text{rreplace}[r](\text{rstr}[s_1]; \text{rstr}[s_2]) \mapsto \text{rstr}[\text{subst}(r; s_1; s_2)]$ by SS-
277 Replace-LR* and SS-E-Replace. Therefore $e \mapsto^* \text{rstr}[\text{subst}(r; s_1; s_2)]$ by
278 RT-Step.

279 It suffices to show $e \Downarrow \text{rstr}[\text{subst}(r; s_1; s_2)]$, which follows by S-E-Replace
280 from the facts that $e_1 \Downarrow \text{rstr}[s_1]$ and $e_2 \Downarrow \text{rstr}[s_2]$.

281 **Case** $e = \text{rstrcase}(e_1; e_2; x.y.e_3)$. By inversion, $\emptyset \vdash e_1 : \text{stringin}[r]$ and
282 $e_2 : \sigma$. By Type Safety, Canonical Forms and Termination $e_1 \mapsto^*$
283 $\text{stringin}[s_1]$ and by induction $e_1 \Downarrow \text{stringin}[s_1]$. Similarly, $e_2 \mapsto^* v_2$ and
284 $\emptyset \vdash e_2 \Downarrow v_2$.

285 By SS-E-Case-LR*, $\text{rstrcase}(e_1; e_2; x.y.e_3) \mapsto^* \text{rstrcase}(v_1; v_2; x.y.e_3)$.

286 Note that either $s_1 = \epsilon$ or $s_1 = as$ because we define strings as either
287 empty or finite sequences of characters. We proceed by cases.

288 If $s_1 = \epsilon$ then $\text{rstrcase}(v; v_2; x.y.e_3) \mapsto v_2$ by SS-E-Case- ϵ . Therefore,
289 by RT-Step, $e \mapsto^* v_2$. Recall $e_1 \Downarrow \text{rstr}[\epsilon]$ and $e_2 \Downarrow v_2$, which is enough
290 to establish by S-E-Case- ϵ that $e \Downarrow v_2$.

291 If $s_1 = as$ instead, then $\text{rstrcase}(\text{rstr}[s_1]; v_2; x.y.e_3) \mapsto [\text{rstr}[a], \text{rstr}[s]/x, y]e_3$
292 by SS-E-Case-Concat. Inversion of the typing relation satisfies the as-
293 sumptions necessary to appeal to termination. Therefore,

$$[\mathbf{rstr}[a], \mathbf{rstr}[s]/x, y]e_3 \mapsto^* v \text{ for } v \text{ val.}$$

294 It follows by RT-Step that $e \mapsto^* v$.

295 Note that the substitution does not change the structure of e_3 . So by
 296 induction, $[\mathbf{rstr}[a], \mathbf{rstr}[s]/x, y]e_3 \Downarrow v$. Recall that $e_1 \Downarrow \mathbf{rstr}[s_1]$ and so by
 297 S-E-Case it follows that $e \Downarrow [a, s/x, y]e_3 \Downarrow v$.

298 The cases for coercion and checking are straightforward. □

299 1.4 Extension of Safety for Small Step Semantics

300 **Theorem 11** (Type Safety). *If $\emptyset \vdash e : \sigma$ then $e \Downarrow v$ and $\emptyset \vdash v : \sigma$.*

301 *Proof.* If $\emptyset \vdash e : \sigma$ then $e \mapsto^* v$ for $v \text{ val}$ by termination. Therefore, $e \Downarrow v$ by
 302 part 2 of the semantic correspondence theorem.

303 Since $\emptyset \vdash e : \sigma$ and $e \mapsto^* v$, it follows that $\emptyset \vdash v : \sigma$ by type safety for the
 304 small step semantics. □

305 1.4.1 The Security Theorem

306 **Theorem 12** (Correctness of Input Sanitation for λ_{RS}). *If $\emptyset \vdash e : \text{stringin}[r]$
 307 and $e \Downarrow \mathbf{rstr}[s]$ then $s \in \mathcal{L}\{r\}$.*

308 *Proof.* If $\emptyset \vdash e : \text{stringin}[r]$ and $e \Downarrow \mathbf{rstr}[s]$ then $\emptyset \vdash \mathbf{rstr}[s] : \text{stringin}[r]$ by Type
 309 Safety. By inversion of S-T-Rstr, $s \in \mathcal{L}\{r\}$. □

310 2 Proofs of Lemmas and Theorems About λ_P

311 **Theorem 13** (Safety for λ_P). *If $\emptyset \vdash \iota : \tau$ then $\iota \Downarrow \dot{v}$ and $\emptyset \vdash \dot{v} : \tau$.*

312 We can also define canonical forms for regular expressions and strings in
 313 the usual way:

314 **Lemma 14** (Canonical Forms for Target Language).

- 315 • If $\emptyset \vdash \iota : \text{regex}$ then $\iota \Downarrow \text{rx}[r]$ such that r is a well-formed regular
 316 expression.
- 317 • If $\emptyset \vdash \iota : \text{string}$ then $\iota \Downarrow \text{str}[s]$.

3 Proofs and Lemmas and Theorems About Translation

Theorem 15 (Translation Correctness). *If $\Theta \vdash e : \sigma$ then there exists an ι such that $\llbracket e \rrbracket = \iota$ and $\llbracket \Theta \rrbracket \vdash \iota : \llbracket \sigma \rrbracket$. Furthermore, $e \Downarrow v$ and $\iota \Downarrow \dot{v}$ such that $\llbracket v \rrbracket = \dot{v}$.*

Proof. We present a proof by induction on the derivation that $\Theta \vdash e : \sigma$. we write $e \rightsquigarrow \iota$ as shorthand for the final property.

Case $e = \mathbf{rstr}[s]$. Suppose $\Theta \vdash \mathbf{rstr}[s] : \sigma$.

By examination the syntactic structure of conclusions in the relation S-T, we know this is true just in case $\sigma = \mathbf{stringin}[r]$ for some r such that $s \in \mathcal{L}\{r\}$; and of course, there is always such an r .

There are no free variables in $\mathbf{rstr}[s]$, so we might as well proceed from the fact that $\emptyset \vdash \mathbf{rstr}[s] : \mathbf{stringin}[r]$.

By definition of the translation ($\llbracket \cdot \rrbracket$) the following statements hold:

$$\llbracket \mathbf{rstr}[s] \rrbracket = \mathbf{strings} \quad (16)$$

$$\llbracket \mathbf{stringin}[r] \rrbracket = \mathbf{string} \quad (17)$$

$$\llbracket \emptyset \rrbracket = \emptyset \quad (18)$$

Note that $\emptyset \vdash \mathbf{strings} : \mathbf{string}$ by P-T-Str. Recall that contexts are standard and, in particular, can be weakened. So since $\llbracket \Theta \rrbracket$ is either a weakening of \emptyset or \emptyset itself, $\llbracket \Theta \rrbracket \vdash \mathbf{str}[s] : \mathbf{string}$ by weakening.

Summarily, $\mathbf{strings}$ is a term of λ_P such that $\llbracket \Theta \rrbracket \vdash \mathbf{strings} : \llbracket \sigma \rrbracket$

It remains to be shown that there exist v, \dot{v} such that $\mathbf{rstr}[s] \Downarrow v$, $\mathbf{strings} \Downarrow \dot{v}$, and $\llbracket v \rrbracket = \dot{v}$. But this is immediate because each term evaluates to itself and we have already established the equality.

Case $e = \mathbf{rconcat}(e_1; e_2)$. This case is an obvious appeal to induction.

Case $e = \mathbf{rstrcase}(e_1; e_2; x, y.e_3)$. This case relies on our definition of context translation.

Suppose $\Psi \vdash \mathbf{rstrcase}(e_1; e_2; x, y.e_3) : \sigma$. By inversion of the typing relation it follows that $\Psi \vdash e_1 : \mathbf{stringin}[r]$, $\Psi \vdash e_2 : \sigma$ and $\Psi, x : \mathbf{stringin}[\mathbf{lhead}(r)], y : \mathbf{stringin}[\mathbf{ltail}(r)] \vdash e_3 : \sigma$.

344 By induction, there exists an ι_1 such that $\llbracket e_1 \rrbracket = \iota_1$, $\llbracket \Psi \rrbracket \vdash \iota_1 : \llbracket \sigma \rrbracket$, and
345 $e_1 \rightsquigarrow \iota_1$. Similarly for e_2 and some ι_2 .
346 By canonical forms, $e_1 \Downarrow \mathbf{rstr}[s]$ and so $\iota_1 \Downarrow \mathbf{str}[s]$ by \rightsquigarrow .
347 Choose $\iota = \text{concat}(\iota_1; \iota_2)x, y.\iota_3$ and note that by the properties estab-
348 lished via induction, $\llbracket e \rrbracket = \iota$ and $\llbracket \Psi \rrbracket \vdash \iota : \llbracket \sigma \rrbracket$.
349 Suppose $s = \epsilon$. Then $e \Downarrow v$ where $e_2 \Downarrow v$ and $\iota \Downarrow \dot{v}$ where $\iota_2 \Downarrow \dot{v}$. But
350 recall that $e_2 \rightsquigarrow v_2$ and so $\llbracket v \rrbracket = \dot{v}$.
351 Suppose otherwise that $s = at$ for some character a and string t . Then
352 $e \Downarrow v$ where $[a, t/x, y]e_3 \Downarrow v$. Similarly, $\iota \Downarrow \dot{v}$ where $[a, t/x, y]\iota_3 \Downarrow \dot{v}$

353 □

354 **Theorem 16** (Correctness of Input Sanitation for Translated Terms). *If*
355 $\llbracket e \rrbracket = \iota$ and $\emptyset \vdash e : \mathbf{stringin}[r]$ then $\iota \Downarrow \mathbf{str}[s]$ for $s \in \mathcal{L}\{r\}$.

356 *Proof.* By Theorem 15 and the rules given, $\iota \Downarrow \mathbf{str}[s]$ implies that $e \Downarrow \mathbf{rstr}[s]$.
357 Theorem 12 together with the assumption that e is well-typed implies that
358 $s \in \mathcal{L}\{r\}$. □
