5 **1 String and Language Replacement**

6 **1.1 The Trivial Definition**

7 **1.2 An Automaton Construction**

8 Insert Automaton stuff...

9 **1.3 Toward a Precise Definition**

10 **2 Proofs of Lemmas and Theorems about λ_{RS}**

11 This section presents proofs of lemmas and theorems about the type systems
12 presented in [1]. In addition, we provide some examples to help motivate and
13 explain definitions.

14 To facilitate the type safety proof, we introduce a small step semantics
15 for both λ_{RS} and λ_P . All theorems in this section are proven as stated in [1].

16 Theorems and lemmas appearing in [1] are numbered, while supporting
17 facts are lettered.

2.1 Head and Tail Operations

Definition 1 (Definition of $\text{lhead}(r)$). The relation $\text{lhead}(r) = r'$ is defined in terms of the structure of r :

- $\text{lhead}(\epsilon) = \epsilon$
- $\text{lhead}(\cdot) = a_1 + a_2 + \dots + a_n$ for all $a_i \in \Sigma$ where $|\Sigma| = n$.
- $\text{lhead}(a) = a$
- $\text{lhead}(r_1 \cdot r_2) = \text{lhead}(r_1)$
- $\text{lhead}(r_1 + r_2) = \text{lhead}(r_1) + \text{lhead}(r_2)$
- $\text{lhead}(r*) = \epsilon + \text{lhead}(r)$

Definition 2 (Brzowski's Derivative). The *derivative of r with respect to s* is denoted by $\delta_s(r)$ and is $\delta_s(r) = \{t \mid st \in \mathcal{L}\{r\}\}$.

Definition 3 (Definition of $\text{ltail}(r)$). The relation $\text{ltail}(r) = r'$ is defined in terms of $\text{lhead}(r)$. Note that $\text{lhead}(r) = a_1 + a_2 + \dots + a_i$. We define $\text{ltail}(r) = \delta_{a_1}(r) + \delta_{a_2}(r) + \dots + \delta_{a_i}(r)$.

TR Example A (All the heads of all the tails can be more than one head and tail). $r \neq \text{lhead}(r) \cdot \text{ltail}(r)$.

Proof. A simple counter-example is $ab + cd$. Note that $\text{lhead}(ab + cd) = a + c$ and $\text{ltail}(ab + cd) = b + d$. Therefore, $\{ad, bc\} \subset \mathcal{L}\{\text{lhead}(ab + cd) \cdot \text{ltail}(ab + cd)\}$ even though neither of these is in $\mathcal{L}\{r\}$. \square

clean up these paragraphs Example A does not cause type soundness problems for **strcase** because $s \in \mathcal{L}\{r\} \implies s \in \text{lhead}(r) \cdot \text{ltail}(r)$ is the property required for soundness. Still, in a production implementation, it will make sense to massage the definitions of $\text{lhead}(r)$ and $\text{ltail}(r)$ so that type information is not unnecessarily lost during sub-string operations.

This is a general pattern in string operations – λ_{RS} simulates common operations on strings within the type system. If there is an operation for concatenating to strings, we define an operation for concatenating to regular expressions. If there is an operation for peeling off the first (n) characters of a string, then we define an operation for peeling off the first (n) characters of a regular expression.

50 It is important to note, however, that we need not *exactly* simulate the
 51 action of string operations using regular expressions. In the case of con-
 52 catenation, we lose some information – of course the string ad is never in r ,
 53 but after decomposing the string, our type tells us this might actually be the
 54 case. That’s okay, because the types are conservative in their approximation.
 55 Soundness is never violated.

56 In the case of string replacement, there are *trivial* definitions of substitu-
 57 tion (on strings) and replacement (on languages) which over-approximate the
 58 effect of a substitution. Closing these gaps in approximation is important,
 59 and motivates the string operations portion of this TR.

60 2.2 Some Corollaries About Substitution and Language 61 Replacement

62 **Definition 4** (`subst`). We consider several choices in the previous section.

63 **Definition 5** (`lreplace`). We consider several choices in the previous sec-
 64 tion.

65 **Proposition 6** (Closure). *If $\mathcal{L}\{r\}, \mathcal{L}\{r_1\}$ and $\mathcal{L}\{r_2\}$ are regular languages,
 66 then $\mathcal{L}\{\text{lreplace}(r, r_1, r_2)\}$ is also a regular language.*

67 *Proof.* Correctness implies closure. □

68 **Proposition 7** (Substitution Correspondence). *If $s_1 \in \mathcal{L}\{r_1\}$ and $s_2 \in$
 69 $\mathcal{L}\{r_2\}$ then $\text{subst}(r; s_1; s_2) \in \mathcal{L}\{\text{lreplace}(r, r_1, r_2)\}$.*

70 *Proof.* This is exactly the correctness result proven for some pairs of `subst`
 71 and `replace` in the previous section. □

72 **Lemma 8** (Properties of Regular Languages.).

- 73 • *If $s_1 \in \mathcal{L}\{r_1\}$ and $s_2 \in \mathcal{L}\{r_2\}$ then $s_1 s_2 \in \mathcal{L}\{r_1 \cdot r_2\}$.*
- 74 • *For all strings s and regular expressions r , either $s \in \mathcal{L}\{r\}$ or $s \notin \mathcal{L}\{r\}$.*
- 75 • *Regular languages are closed under reversal.*

76 Lemma 8 states some well-known properties about regular expressions.

77 **Lemma 9.** *If $\emptyset \vdash e : \text{stringin}[r]$ then r is a well-formed regular expression.*

78 *Proof.* The proof proceeds by induction on the derivation of the premise. The
 79 only non-trivial cases (those which require more than an appeal to inversion)
 80 are S-T-Case, S-T-Replace and S-T-Concat.

81 In the S-T-Case case, note that **lhead** and **ltail** are total functions for
 82 well-formed regular expressions to well-formed regular expressions.

83 In the S-T-Concat case, note that 6 implies that if r_1 and r_2 are regular
 84 expressions then so is $r_1 \cdot r_2$.

85 In the S-T-Replace case, it suffices to show that **lreplace**(r, r_1, r_2) is a
 86 regular expression assuming (inductively) that r, r_1 and r_2 are all regular
 87 expressions. This follows from the Closure proposition. \square

88 2.3 The Small Step Semantics

89 To prove type safety and the security theorem for the big step semantics, we
 90 first prove type safety for a small step semantics in Figure ?? and then extend
 91 this to the big step semantics in Figure ?? by proving a correspondence
 92 between the semantics.

93 Note that small step evaluation for λ_{RS} is terminating: if $\emptyset \vdash e : \sigma$ then
 94 $e \mapsto^* v$ such that v val. We do not develop the full proof here, but note that
 95 the simply typed lambda calculus terminates. For the string fragment, ob-
 96 serve that the S-T- rules do not add any non-trivial binding structure because
 97 substitutions $[e/x]e'$ may only occur in the special case where $e = \mathbf{rstr}[s]$, so
 98 that the length of the term never increases and the number of free variables
 99 strictly decreases. Therefore, the standard normalization argument proceeds
 100 without complication after fixing an evaluation order for the compatibility
 101 rules (all our other proofs are agnostic to evaluation order).

102 **TR Lemma B** (Canonical Forms). *Suppose v val.*

103 *If $\emptyset \vdash v : \mathbf{stringin}[r]$ then $v = \mathbf{rstr}[s]$.*

104 *If $\emptyset \vdash v : \sigma \rightarrow \sigma'$ then $v = \lambda x.e'$ for some e' .*

105 *Proof.* By inspection of valuation and typing rules. \square

106 For the sake of completeness, we include a statement of the weaker lemma
 107 stated in the paper:

108 **Lemma 10** (Canonical Forms for the String Fragment of λ_{RS}). *If $\emptyset \vdash e :$
 109 $\mathbf{stringin}[r]$ and $e \Downarrow v$ then $v = \mathbf{rstr}[s]$.*

110 *Proof.* This fact follows directly from Lemma B. \square

111 **TR Lemma C** (Progress of small step semantics.). *If $\vdash e : \sigma$ either e **val** or*
 112 *$e \mapsto e'$ for some e' .*

113 *Proof.* The proof proceeds by induction on the derivation of $\vdash e : \sigma$.

114 **λ fragment.** Cases SS-T-Var, SS-T-Abs, and SS-T-App are exactly as
 115 in a proof of type safety for the simply typed lambda calculus.

116 **S-T-Stringin-I.** Suppose $\vdash \text{rstr}[s] : \text{stringin}[s]$. The $\text{rstr}[s]$ **val** by SS-E-
 117 RStr.

118 **S-T-Concat.** Suppose $\vdash \text{rconcat}(e_1; e_2) : \text{stringin}[s]$. By inversion and
 119 induction, $e_1 \mapsto e'_1$ or e_1 **val** and similarly for e_2 . If e_1 steps, then SS-E-
 120 Concat-Left applies and so $\text{rconcat}(e_1; e_2) \mapsto \text{rconcat}(e'_1; e_2)$. Similarly,
 121 if e_2 steps then e steps by SS-E-Concat-Right.

122 In the remaining case, e_1 **val** and e_2 **val**. But then it follows by canonical
 123 forms that $e_1 = \text{rstr}[s_1]$ and $e_2 = \text{rstr}[s_2]$. Note that $\text{rconcat}(\text{rstr}[s_1]; \text{rstr}[s_2]) \mapsto$
 124 $\text{rstr}[s_1 s_2]$ by SS-E-Concat.

125 **S-T-Case.** Suppose $e = \text{rstrcase}(e_1; e_2; x, y.e_3)$. By inversion, $e_1 :$
 126 $\text{stringin}[r]$. From this fact, induction, and canonical it follows that
 127 $e_1 \mapsto e'_1$ or $e_1 = \text{rstr}[s]$. In the former case, e steps by S-E-Case-Left.
 128 In the latter case, note that $s = \epsilon$ or $s = at$ for some string t . If
 129 $s = \epsilon$ then e steps by S-E-Case- ϵ -Val, and if $s = at$ the e steps by
 130 S-E-Case-Concat.

S-T-Replace. Suppose $e = \text{rreplace}[r](e_1; e_2)$ and $e : \text{stringin}[r']$ where,
 by inversion of S-T-Replace,

$$\vdash e_1 : \text{stringin}[r_1] \tag{1}$$

$$\vdash e_2 : \text{stringin}[r_2] \tag{2}$$

$$\text{lreplace}(r, r_1, r_2) = r' \tag{3}$$

131 By (1), inversion and induction e_1 **val** or $e_1 \mapsto e'_1$ for some e'_1 . If $e_1 \mapsto e'_1$
 132 then e steps by SS-E-Replace-Left. Similarly, if e_2 steps then e steps
 133 by SS-E-Replace-Right. The only remaining case is where e_1 **val** and
 134 also e_2 **val**. But then by canonical forms, $e_1 = \text{rstr}[s_1]$ and $e_2 = \text{rstr}[s_2]$.
 135 In this case, $e \mapsto \text{rstr}[[r/]]s_1 s_2$ by SS-E-Replace.

136 **S-T-SafeCoerce.** Suppose that $\vdash \text{rcoerce}[r](e_1) : \text{stringin}[r]$. By in-
 137 version of S-T-SafeCoerce, $\vdash e_1 : \text{stringin}[r']$. By induction, $e_1 \text{ val}$ or
 138 $e_1 \mapsto e'_1$ for some e'_1 . If $e_1 \mapsto e'_1$ then e steps by SS-E-SafeCoerce-Step.
 139 Otherwise, $e_1 \text{ val}$ and by canonical forms $e_1 = \text{rstr}[s]$. In this case,
 140 $e = \text{rcoerce}[r](\text{rstr}[s]) \mapsto \text{rstr}[s]$ by SS-E-SafeCoerce.

S-T-SafeCheck Suppose that $\vdash \text{rcheck}[r](e_1; :: \text{stringin}[])r$. By inver-
 sion of S-T-Check:

$$\vdash e_0 : \text{stringin}[r_0] \quad (4)$$

$$x : \text{stringin}[r] \vdash e_1 : \sigma \quad (5)$$

$$\vdash e_2 : \sigma \quad (6)$$

141 By (6) and induction, $e_0 \mapsto e'_0$ or $e_0 \text{ val}$. In the former case e steps by
 142 SS-E-Check-StepRight. Otherwise, by canonical forms $e_0 = \text{rstr}[s]$. By
 143 Lemma 8, $s \in \mathcal{L}\{r_0\}$ or else not. In either case, the SS-E-Check-Ok
 144 and SS-E-Check-NotOk steps e .

145 □

146 **TR Lemma D** (Preservation for Small Step Semantics). *If $\emptyset \vdash e : \sigma$ and*
 147 *$e \mapsto e'$ then $\emptyset \vdash e' : \sigma$.*

148 *Proof.* By induction on the derivation of $e \mapsto e'$.

149 **λ fragment.** Cases SS-T-Var, SS-T-Abs, and SS-T-App are exactly as
 150 in a proof of type safety for the simply typed lambda calculus.

151 **SS-E-Concat-Left.** Suppose $e = \text{rconcat}(e_1; e_1) \mapsto \text{rconcat}(e'_1; e_2)$. By
 152 inversion of S-T-Concat, $\vdash e_1 : \text{stringin}[r_1]$ where $\vdash e : \text{stringin}[r_1 r_2]$. By
 153 induction if $e_1 \mapsto e'_1$ then $\vdash e'_1 : \text{stringin}[r_1]$. Therefore, $\vdash \text{rconcat}(e'_1; e_2) :$
 154 $\text{stringin}[r_1 r_2]$.

155 **SS-E-Concat-Right.** Similar to SS-E-Concat-Left.

156 **SS-E-Concat.** Suppose $\text{rconcat}(\text{rstr}[s_1]; \text{rstr}[s_2]) : \text{stringin}[r_1 r_2]$ and
 157 $\text{rconcat}(\text{rstr}[s_1]; \text{rstr}[s_2]) \mapsto \text{rstr}[s_1 s_2]$. Then by inversion $\text{rstr}[s_1] : \text{stringin}[r_1]$
 158 and similarly for $\text{rstr}[s_2]$. Therefore, $s_1 \in \mathcal{L}\{r_1\}$ and $s_2 \in \mathcal{L}\{r_2\}$
 159 from which it follows by Lemma 8 that $s_1 s_2 \in \mathcal{L}\{r_1 r_2\}$. Therefore,
 160 $\vdash \text{rstr}[s_1 s_2] : \text{stringin}[r_1 r_2]$ by S-T-Rstr.

S-E-Case-Left. Suppose that $e = \text{rstrcase}(e_1; e_2; x, y.e_3) \mapsto \text{rstrcase}(e'_1; e_2; x, y.e_3)$ and $\emptyset \vdash e : \text{stringin}[r]$. By inversion of S-T-Case:

$$\vdash e_1 : \text{stringin}[r] \quad (7)$$

$$\vdash e_2 : \sigma \quad (8)$$

$$x : \text{stringin}[\text{lhead}(r)], y : \text{stringin}[\text{ltail}(r)] \vdash e_3 : \sigma \quad (9)$$

161 By (7) and the assumption that $e_1 \mapsto e'_1$, it follows by induction that
 162 $e'_1 : \text{stringin}[r]$. This fact together with (8) and (9) implies by S-T-Case
 163 that $\text{rstrcase}(e'_1; e_2; x, y.e_3) : \sigma$.

SS-E-Case-Right. Suppose that $e = \text{rstrcase}(e_1; e_2; x, y.e_3) \mapsto \text{rstrcase}(e_1; e'_2; x, y.e_3)$ and $\emptyset \vdash e : \text{stringin}[r]$. By inversion of S-T-Case:

$$\vdash e_1 : \text{stringin}[r] \quad (10)$$

$$\vdash e_2 : \sigma \quad (11)$$

$$x : \text{stringin}[\text{lhead}(r)], y : \text{stringin}[\text{ltail}(r)] \vdash e_3 : \sigma \quad (12)$$

164 By (11) and the assumption that $e_2 \mapsto e'_2$, it follows by induction that
 165 $e'_2 : \text{stringin}[r]$. This fact together with (10) and (12) implies by S-T-
 166 Case that $\text{rstrcase}(e_1; e'_2; x, y.e_3) : \sigma$.

167 **SS-E-Case- ϵ -Val.** Suppose $e = \text{rstrcase}(-; e_2; -) : \sigma$ and $e \mapsto e_2$. By
 168 inversion of S-T-Case, $e_2 : \sigma$.

SS-E-Case-Concat. Suppose that $e = \text{rstrcase}(\text{rstr}[as]; e_2; x, y.e_3) \mapsto [\text{rstr}[a], \text{rstr}[s]/x, y]e_3$ and that $e : \sigma$. By inversion of S-T-Case:

$$\vdash \text{rstr}[as] : \text{stringin}[r] \quad (13)$$

$$\vdash \text{rstr}[e_2] : \sigma \quad (14)$$

$$x : \text{stringin}[\text{lhead}(r)], y : \text{stringin}[\text{ltail}(r)] \vdash e_3 : \sigma \quad (15)$$

169 We know that $as \in \mathcal{L}\{r\}$ by (13) and inversion of S-T-Rstr. Therefore,
 170 $a \in \text{lhead}(r)$ by definition of lhead . Furthermore, $\text{ltail}(r) = \dots|\delta_a r| \dots$ by
 171 definition of ltail . Note that $s \in \mathcal{L}\{\delta_a r\}$ by definition of the derivative,
 172 and so $s \in \text{ltail}(r)$

173 From these facts about a and s we know by S-T-Rstr that $\vdash \text{rstr}[a] :$
 174 $\text{stringin}[\text{lhead}(r)]$ and $\vdash \text{rstr}[s] : \text{stringin}[\text{lhead}(r)]$. It follows by (15) that
 175 $\vdash [\text{rstr}[a], \text{rstr}[s]/x, y]e_3 : \sigma$.

176 Cases **SS-E-Replace-Left**, **SS-E-Replace-Right**, **SS-E-Check-**
 177 **StepLeft**, **SS-E-SafeCoerce-Step**, **SS-E-Check-StepRight**. At
 178 this point the method for handling compatibility cases is clear; there-
 179 fore, we elide these cases.

180 **Case SS-E-Replace.**

Suppose $e = \text{rreplace}[r](\text{rstr}[s_1]; \text{rstr}[s_2]) \mapsto \text{rstr}[\text{subst}(r; s_1; s_2)]$. Assume $\emptyset \vdash e : \text{stringin}[r']$ for $r' = \text{lreplace}(r, r_1, r_2)$. Then by inversion of S-T-Replace:

$$\begin{aligned} \emptyset \vdash \text{rstr}[s_1] &: \text{stringin}[r_1] \\ \emptyset \vdash \text{rstr}[s_2] &: \text{stringin}[r_2] \end{aligned}$$

181 from which follows that $s_1 \in \mathcal{L}\{r_1\}$ and $s_2 \in \mathcal{L}\{r_2\}$. Therefore,
 182 $\text{subst}(r; s_1; s_2) \in \mathcal{L}\{\text{lreplace}(r, r_1, r_2)\}$ by Theorem 7. It is finally
 183 derivable by S-T-Rstr that:

$$184 \quad \emptyset \vdash \text{rstr}[\text{subst}(r; s_1; s_2)] : \text{stringin}[\text{lreplace}(r, r_1, r_2)].$$

185 **Case SS-E-SafeCoerce.** Suppose that $\text{rcoerce}[r](s_1) \mapsto \text{rstr}[s_1]$ and
 186 that $\emptyset \vdash \text{rcoerce}[r](s_1) : \text{stringin}[r]$. By inversion of S-T-SafeCoerce we
 187 know that $s \in \mathcal{L}\{r\}$ from which it follows by S-T-Rstr that $\emptyset \vdash s :$
 188 $\text{stringin}[r]$.

189 **Case SS-E-Check-Ok.** Suppose that $\text{rcheck}[r](\text{rstr}[s]; x.e_1; e_2) \mapsto [\text{rstr}[s]/x]e_1$,
 190 $s \in \mathcal{L}\{r\}$ and that $\emptyset \vdash \text{rcheck}[r](\text{rstr}[s]; x.e_1; e_2) : \sigma$. By inversion of
 191 S-T-Check, $x : \text{stringin}[r] \vdash e_1 : \sigma$. Note that $s \in \mathcal{L}\{r\}$ implies that
 192 $s : \text{stringin}[r]$ by S-T-RStr. Therefore, $\emptyset \vdash [\text{rstr}[s]/x]e_1 : \sigma$

193 **Case SS-E-Check-NotOk.** Suppose that $\text{rcheck}[r](\text{rstr}[s]; x.e_1; e_2) \mapsto$
 194 e_2 , $s \notin \mathcal{L}\{r\}$ and that $\emptyset \vdash \text{rcheck}[r](\text{rstr}[s]; x.e_1; e_2) : \sigma$. By inversion of
 195 S-T-Check, $\emptyset \vdash e_2 : \sigma$.

196 □

197 **TR Theorem E** (Type Safety for small step semantics.). *If $\emptyset \vdash e : \sigma$ then*
 198 *either $e \text{ val}$ or $e \mapsto^* e'$ and $\emptyset \vdash e' : \sigma$.*

199 *Proof.* Follows directly from progress and preservation. □

200 **2.3.1 Semantic Correspondence between Big and Small Step Se-**
 201 **mantics for λ_{RS}**

202 Before extending these the type safety result fir the small step semantics
 203 to the big step semantics, we first establish a correspondence between the
 204 big step semantics in Figure ?? and the small step semantics in Figure 5.
 205 We prove the relevant theorems for the \mapsto relation because these proofs are
 206 easier. We then extend this result via the correspondence theorem to the
 207 more concise big step semantics presented in [1].

208 **TR Theorem F** (Semantic Correspondence for λ_{RS} (Part I)). *If $e \Downarrow v$ then*
 209 *$e \mapsto^* v$.*

210 *Proof.* We proceed by structural induction on e .

211 **Case** $e = \lambda x.e_1$. The only applicable rule is S-E-Abs, so $v = \lambda x.e_1$.
 212 Note that $\lambda x.e_2 \mapsto^* \lambda x.e_2$ by RT-Refl.

Case $e = e_1(e_2)$. The only applicable rule is S-E-App. By inversion,
 we establish that the following:

$$\begin{aligned} e_1 &\Downarrow \lambda x.e'_1 \\ e_2 &\Downarrow v_2 \\ [v_2/x]e'_1 &\Downarrow v \end{aligned}$$

From which it follows by induction that:

$$\begin{aligned} e_1 &\mapsto^* \lambda x.e'_1 \\ e_2 &\mapsto^* v_2 \\ [v_2/x]e'_1 &\mapsto^* v \end{aligned}$$

Note that the following rule is derivable by repeating applications of
 the left and right compatibility rules for application:

$$\frac{\text{L*-APP} \quad e_1 \mapsto^* e'_1 \quad e_2 \mapsto^* e'_2}{e_1(e_2) \mapsto^* e'_1(e'_2)}$$

213 From these facts and L-AppAbs, we may establish that $e_1(e_2) \mapsto^*$
 214 $(\lambda x.e_2)(v_2) \mapsto [v_2/x]e_2$. Note that $[v_2/x]e_2 \mapsto^* v$, so by RT-Trans it
 215 follows that $e = e_1(e_2) \mapsto^* v$.

216 **Case** $e = \mathbf{rstr}[s]$. The only applicable rule is S-E-RStr, so $v = \mathbf{rstr}[s]$.
 217 By RT-Refl, $\mathbf{rstr}[s] \mapsto^* \mathbf{rstr}[s]$.

Case $e = \mathbf{rconcat}(e_1; e_2)$. The only applicable rule is S-E-Concat, so
 $v = \mathbf{rstr}[s_1 s_2]$. By inversion, $e_1 \Downarrow \mathbf{rstr}[s_1]$ and $e_2 \Downarrow \mathbf{rstr}[s_2]$. By induction,
 $e_1 \mapsto^* \mathbf{rstr}[s_1]$ and $e_2 \mapsto^* \mathbf{rstr}[s_2]$. Note that the rule following is
 derivable:

$$\frac{\text{SS-E-CONCAT-LR}^* \quad \begin{array}{c} e_1 \mapsto^* e'_1 \quad e_2 \mapsto^* e'_2 \end{array}}{\mathbf{rconcat}(e_1; e_2) \mapsto^* \mathbf{rconcat}(e'_1; e'_2)}$$

218 From these facts, it follows that $\mathbf{rconcat}(e_1; e_2) \mapsto^* \mathbf{rconcat}(\mathbf{rstr}[s_1]; \mathbf{rstr}[s_2])$.
 219 Finally, $\mathbf{rconcat}(\mathbf{rstr}[s_1]; \mathbf{rstr}[s_2]) \mapsto \mathbf{rstr}[s_1 s_2]$ by SS-E-Concat. By RT-
 220 Step, it follows that $\mathbf{rconcat}(e_1; e_2) \mapsto^* \mathbf{rstr}[s_1 s_2]$.

221 **Case** $e = \mathbf{rstrcase}(e_1; e_2; x, y.e_3)$.

There are two subcases. For the first, suppose $\mathbf{rstrcase}(e_1; e_2; x, y.e_3) \Downarrow v$
 was finally derived by S-E-Case- ϵ . By inversion:

$$\begin{array}{c} e_1 \Downarrow \mathbf{rstr}[\epsilon] \\ e_2 \Downarrow v \end{array}$$

from which it follows by induction that:

$$\begin{array}{c} e_1 \mapsto^* \mathbf{rstr}[\epsilon] \\ e_2 \mapsto^* v \end{array}$$

222 Note that the following rule is derivable:

$$\frac{\text{SS-E-CASE-LR}^* \quad \begin{array}{c} e_1 \mapsto^* e'_1 \quad e_2 \mapsto^* e'_2 \end{array}}{\mathbf{rstrcase}(e_1; e_2; x, y.e_3) \mapsto^* \mathbf{rstrcase}(e'_1; e'_2; x, y.e_3)}$$

223 From these facts it follows that $e \mapsto^* \mathbf{rstrcase}(\mathbf{rstr}[\epsilon]; v; x, y.e_3)$. By
 224 S-E-Case- ϵ -Val and RT-Step it follows that $e \mapsto^* v$.

225 Now consider the other case where $\mathbf{rstrcase}(e_1; e_2; x, y.e_3) \Downarrow v$ was fi-
 226 nally derived by S-E-Case-Concat. By inversion, $e_1 \Downarrow \mathbf{rstr}[as]$ and

227 $[\mathbf{rstr}[a], \mathbf{rstr}[s]/x, y]e_3 \Downarrow v$. From these facts it follows by induction that
 228 $e_1 \mapsto^* \mathbf{rstr}[as]$ and $[\mathbf{rstr}[a], \mathbf{rstr}[s]/x, y]e_3 \mapsto^* v$.

229 By the first of these facts, it is derivable via SS-E-Case-LR* that
 230 $e \mapsto^* \mathbf{rstrcase}(e'_1; \mathbf{rstr}[as]; x, y.e_3)$. SE-E-Case-Concat applies to this
 231 form, so by RT-Step we know $e \mapsto^* [\mathbf{rstr}[a], \mathbf{rstr}[s]/x, y]e_3$. Recall that
 232 $[\mathbf{rstr}[a], \mathbf{rstr}[s]/x, y]e_3 \mapsto^* v$, so by RT-Trans we finally derive $e \mapsto^* v$.

Case $e = \mathbf{rreplace}[r](e_1; e_2)$. There is only one applicable rule, so $v = \mathbf{rstr}[s]$ and by inversion it follows that:

$$\begin{aligned} e_1 &\Downarrow \mathbf{rstr}[s_1] \\ e_2 &\Downarrow \mathbf{rstr}[s_2] \end{aligned}$$

From which it follows by induction that:

$$\begin{aligned} e_1 &\mapsto^* \mathbf{rstr}[s_1] \\ e_2 &\mapsto^* \mathbf{rstr}[s_2] \end{aligned}$$

233 Furthermore, $\mathbf{subst}(r; s_1; s_2) = s$ by induction. Note that the following
 234 rule is derivable:

$$\frac{\text{SS-E-REPLACE-LR}^* \quad \begin{array}{c} e_1 \mapsto^* e'_1 \quad e_2 \mapsto^* e'_2 \end{array}}{\mathbf{rreplace}[r](e_1; e_2) \mapsto^* \mathbf{rreplace}[r](e'_1; e'_2)}$$

235 From these facts, $\mathbf{rreplace}[r](e_1; e_2) \mapsto^* \mathbf{rreplace}[r](\mathbf{rstr}[s_1]; \mathbf{rstr}[s_2])$.

236 Finally, $\mathbf{rreplace}[r](\mathbf{rstr}[s_1]; \mathbf{rstr}[s_2]) \mapsto \mathbf{subst}(r; s_1; s_2)$.

237 From these two facts we know via TR-Step that $\mathbf{rreplace}[r](e_1; e_2) \mapsto^*$
 238 $\mathbf{rreplace}[r](e_1; e_2)$. Recall that $\mathbf{subst}(r; s_1; s_2) = s$, from which the con-
 239 clusion follows.

240 **Case** $e = \mathbf{rcoerce}[r](e_1)$. In this case $e \Downarrow v$ is only finally derivable via
 241 S-E-SafeCoerce. Therefore, $v = \mathbf{rstr}[s]$ and by inversion $e_1 \Downarrow \mathbf{rstr}[s]$. By
 242 induction, $e_1 \mapsto^* \mathbf{rstr}[s]$.

243 The following rule is derivable:

$$\begin{array}{c}
\text{SS-E-SAFE-CoERCE-STEP} \\
\frac{e \mapsto^* e'}{\text{rcoerce}[r](e) \mapsto^* \text{rcoerce}[r](e')}
\end{array}$$

244 Applying this rule at $e_1 \mapsto^* \mathbf{rstr}[s]$ derives $\text{rcoerce}[r](e_1) \mapsto^* \text{rcoerce}[r](\mathbf{rstr}[s])$.
 245 In the final step, $\text{rcoerce}[r](\mathbf{rstr}[s]) \mapsto \mathbf{rstr}[s]$ by SS-E-SafeCoerce. From
 246 this fact, we may derive via RT-Trans that $e \mapsto^* \mathbf{rstr}[s]$ as required.

247 **Case** $e = \text{rcheck}[r](e_1; x.e_2; e_3)$.

248 Note that the rule following is derivable:

$$\begin{array}{c}
\text{SS-E-CHECK-STEP} \\
\frac{e_1 \mapsto^* e'_1 \quad e_3 \mapsto^* e'_3}{\text{rcheck}[r](e_1; x.e_2; e_3) \mapsto^* \text{rcheck}[r](e'_1; x.e_2; e'_3)}
\end{array}$$

249 There are two ways to finally derive $e \Downarrow v$. In both cases, $e_1 \Downarrow \mathbf{rstr}[s]$
 250 by inversion. Therefore, in both cases, $e_1 \mapsto^* \mathbf{rstr}[s]$ by induction and
 251 so $e \mapsto^* \text{rcheck}[r](\mathbf{rstr}[s]; x.e_2; e_3)$ by SS-E-Check-Step.

252 Suppose $e \Downarrow v$ is finally derived via SS-E-Check-Ok. By the facts
 253 mentioned above and SS-E-Check-Step, $e \mapsto^* \text{rcheck}[r](\mathbf{rstr}[s]; x.e_2; e_2)$.
 254 Note that by inversion $s \in \mathcal{L}\{r\}$. Therefore, SS-E-Check-Ok applies
 255 and so by RT-Trans $e \mapsto^* [\mathbf{rstr}[s]/x]e_1$. By inversion, $[\mathbf{rstr}[s]/x]e_1 \Downarrow v$.
 256 Therefore, by induction and RT-Step $e \mapsto^* v$ as required.

257 Suppose that $e \Downarrow v$ is instead finally derived via SS-E-Check-NotOk.
 258 By inversion, $e_3 \Downarrow v$ and by induction $e_3 \mapsto^* v$. From these facts at
 259 SS-E-Check-Step, it is derivable that $e \mapsto^* \text{rcheck}[r](\mathbf{rstr}[s]; x.e_2; v)$.

260 Also by inversion, $s \notin \mathcal{L}\{r\}$ and so SS-E-Check-NotOk applies. There-
 261 fore, $\text{rcheck}[r](\mathbf{rstr}[s]; x.e_2; v) \mapsto v$.

262 The conclusion $e \mapsto^* v$ follows from these facts by RT-Step.

263 □

264 Establishing the other direction requires a minor lemma about the rela-
 265 tionship between values and reflexivity in the big step semantics.

266 **TR Theorem G** (Small Step Values are Reflexive in the Big Step Seman-
 267 tics). *If v val in the small step semantics then $v \Downarrow v$.*

268 *Proof.* If v val is derived from SS-E-RStr then S-E-RStr establishes the result.
 269 Otherwise v val is derived from SS-E-Abs and so S-E-Abs establishes the
 270 result. \square

271 **TR Theorem H** (Semantic Correspondence for λ_{RS} (Part II)). *If $e \vdash \tau$,
 272 $e \mapsto^* v$ and v val then $e \Downarrow v$.*

273 *Proof.* The proof proceeds by structural induction on e .

274 **Case** $e = \text{concat}(e_1; e_2)$. By inversion, $\vdash e_1 : \text{stringin}[r_1]$. By Type
 275 Safety, canonical forms and termination it follows that $e_1 \mapsto^* \text{rstr}[s_1]$
 276 for some s_1 . By induction, $e_1 \Downarrow \text{rstr}[s_1]$.

277 Similarly, $e_2 \mapsto^* \text{rstr}[s_2]$ and $e_2 \Downarrow \text{rstr}[s_2]$.

278 Note that $\text{concat}(e_1; e_2) \mapsto^* \text{concat}(\text{rstr}[s_1]; \text{rstr}[s_2]) \mapsto \text{rstr}[s_1 s_2]$ by SS-
 279 E-Concat-LR* and S-E-Concat, and so $e \mapsto^* \text{rstr}[s_1 s_2]$ by TR-Step. So
 280 it suffices to show that $e \Downarrow \text{rstr}[s_1 s_2]$.

281 Finally, $e \Downarrow \text{rstr}[s_1 s_2]$ follows via S-E-Concat from the facts that $e_1 \Downarrow$
 282 $\text{rstr}[s_1]$ and $e_2 \Downarrow \text{rstr}[s_2]$. This completes the case.

283 **Case** $e = \text{rreplace}[r](e_1; e_2)$. By inversion of S-T-Replace, $\vdash e_1 : \text{stringin}[r_1]$
 284 for some r_1 . It follows by type safety, termination and
 285 canonical forms that $e_1 \mapsto^* \text{rstr}[s_1]$. By induction, $e_1 \Downarrow \text{rstr}[s_1]$.

286 Similarly, $e_2 \mapsto^* \text{rstr}[s_2]$ and $e_2 \Downarrow \text{rstr}[s_2]$.

287 Note that $e \mapsto^* \text{rreplace}[r](\text{rstr}[s_1]; \text{rstr}[s_2]) \mapsto \text{rstr}[\text{subst}(r; s_1; s_2)]$ by
 288 SS-Replace-LR* and SS-E-Replace and so $e \mapsto^* \text{rstr}[\text{subst}(r; s_1; s_2)]$ by
 289 TR-Step.

290 It suffices to show $e \Downarrow \text{rstr}[\text{subst}(r; s_1; s_2)]$, which follows by S-E-Replace
 291 from the facts that $e_1 \Downarrow \text{rstr}[s_1]$ and similarly for $e_2 \Downarrow \text{rstr}[s_2]$.

292 **Case** $e = \text{rstrcase}(e_1; e_2; x.y.e_3)$. By inversion, $\vdash e_1 : \text{stringin}[r]$ and $e_2 : \sigma$.
 293 By type safety, canonical forms and termination $e_1 \mapsto^* \text{stringin}[s_1]$
 294 and by induction $e_1 \Downarrow \text{stringin}[s_1]$. Similarly, $e_2 \mapsto^* v_2$ and $\vdash e_2 \Downarrow v_2$.

295 By SS-E-Case-LR*, $\text{rstrcase}(e_1; e_2; x.y.e_1) \mapsto^* \text{rstrcase}(v_1; v_2; x.y.e_2)$.

296 Note that either $s_1 = \epsilon$ or $s_1 = as$ because we define strings as either
 297 empty or finite sequences of characters. We proceed by cases.
 298 If $s_1 = \epsilon$ then $\text{rstrcase}(v; v_2; x, y.e_3) \mapsto v_2$ by SS-E-Case- ϵ . Therefore,
 299 by RT-Step, $e \mapsto^* v_2$. Also, $e_1 \mapsto \text{rstr}[\epsilon]$ and $e_2 \mapsto v_2$ is enough to
 300 establish by S-E-Case- ϵ that $e \Downarrow v_2$.
 301 If $s_1 = as$ instead, then $\text{rstrcase}(\text{rstr}[s_1]; v_2; x, y.e_3) \mapsto [\text{rstr}[a], \text{rstr}[s]/x, y]e_3$
 302 by SS-E-Case-Concat. Inversion of the typing relation satisfies the as-
 303 sumptions necessary to appeal to termination. Therefore,

$$[\text{rstr}[a], \text{rstr}[s]/x, y]e_3 \mapsto^* v \text{ for } v \text{ val.}$$

304 It follows by RT-Step that $e \mapsto^* v$.
 305 Note that the substitution does not change the structure of e_3 . So by
 306 induction, $[\text{rstr}[a], \text{rstr}[s]/x, y]e_3 \Downarrow v$. Recall that $e_1 \Downarrow \text{rstr}[s_1]$ and so by
 307 S-E-Case it follows that $e \Downarrow [a, s/x, y]e_3 \Downarrow v$.

308 The cases for coercion and checking are straightforward. □

309 2.4 Extension of Safety for Small Step Semantics

310 **Theorem 11** (Type Safety). *If $\emptyset \vdash e : \sigma$ then $e \Downarrow v$ and $\emptyset \vdash v : \sigma$.*

311 *Proof.* If $\emptyset \vdash e : \sigma$ then $e \mapsto^* v$ for $v \text{ val}$ by termination and type safety
 312 for the small step semantics. Therefore, $e \Downarrow v$ by part 2 of the semantic
 313 correspondence theorem.

314 Since $\emptyset \vdash e : \sigma$ and $e \mapsto^* v$, it follows that $\emptyset \vdash v : \sigma$ by type safety for the
 315 small step semantics. □

316 2.4.1 The Security Theorem

317 **Theorem 12** (Correctness of Input Sanitation for λ_{RS}). *If $\emptyset \vdash e : \text{stringin}[r]$
 318 and $e \Downarrow \text{rstr}[s]$ then $s \in \mathcal{L}\{r\}$.*

319 *Proof.* If $\emptyset \vdash e : \text{stringin}[r]$ then $\emptyset \vdash \text{rstr}[s] : \text{stringin}[r]$ by type safety. By
 320 inversion of S-T-Rstr, $s \in \mathcal{L}\{r\}$. □
